WHAT?
Our product is a restaurant shift and break scheduling system designed to automatically create employee schedules while considering availability, employee roles, staffing needs, required breaks, working-hour limits, overtime, and employee preferences. The system can also adjust an existing schedule when unexpected changes occur, such as an employee calling out.

WHO?
The primary users are restaurant managers and supervisors who are responsible for creating schedules and maintaining proper staffing throughout the day.

WHY?
Restaurant managers have to balance many requirements when creating and maintaining employee schedules, including availability, staffing, roles, breaks, working hours, and overtime. Unexpected changes such as employee call-outs can make this more difficult because managers may need to quickly determine who can provide coverage while keeping the rest of the schedule valid.

VALUE?
Our product aims to reduce the time and manual decision-making required from restaurant managers by automatically generating schedules and adjusting them when staffing changes occur. The system would maintain required staffing and scheduling constraints while trying to minimize overtime, scheduling conflicts, and unnecessary changes to the existing schedule.

Product Vision Statement
To help restaurant managers efficiently create and adjust employee shift and break schedules by automatically considering staffing needs and scheduling constraints, reducing the time and manual decision-making required to maintain proper coverage.
